- ➑ Conclusion

# Motivation

Edwards curves are extremely useful for cryptography; they offer better safety from the ground up.  
Less work has been done on binary Edwards curves.

# Contributions

In this dissertation, we

# Elliptic Curves and Cryptography

Introduction

Elliptic Curves  
and  
CryptographyBinary  
Edwards  
CurvesPractical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

In the 80s, Koblitz and Miller proposed using the group of points on an elliptic curve as the basis for public key cryptography.

- They offer strong security for much smaller key sizes.
- They have a nice geometric description of the group law.

Conclusion

However, there are some issues...

- What if  $P = \infty$ ? What if  $Q = \infty$ ?
- What if  $P = Q$ ?
- What if  $P.x = Q.x = 0$ ?
- What if  $P = -Q$ ?

The group law has to check for all of these.

# Edwards Curves

Edwards gave a new normal form in 2007, which was then extended by Bernstein and Lange:

$$E_{O,c,d} : x^2 + y^2 = c^2(1 + dx^2y^2)$$

such that  $cd(1 - dc^4) \neq 0$ .

Introduction

Elliptic Curves  
and  
Cryptography

Binary  
Edwards  
Curves

Practical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

## Complete and unified group law

Complete and unified group law

⇒ No special cases (doubling, identity element, etc.)

Complete and unified group law

⇒ No special cases (doubling, identity element, etc.)

⇒ Less prone to side-channel attacks

Complete and unified group law

⇒ No special cases (doubling, identity element, etc.)

⇒ Less prone to side-channel attacks

∴ Safer from the ground up

# Twisted Edwards Curves

These are quadratic twists of Edwards curves, cover more cases; more work is done with them nowadays.

**Their group law is also unified and complete.**

## Characteristic Two

Those were only defined over fields of characteristic  $\neq 2$ .  
Characteristic 2 is nice from an implementation standpoint.  
Bernstein et.al. to the rescue!

# Binary Edwards Curves

$$E_{B,d_1,d_2} : d_1(x+y) + d_2(x^2+y^2) = xy(x+1)(y+1)$$

If the field's defining polynomial has degree  $\geq 3$ , all binary elliptic curves are birationally equivalent **over the base field** to a complete binary Edwards curve.

Introduction

Elliptic Curves  
and  
CryptographyBinary  
Edwards  
CurvesPractical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

More normal forms have been recently proposed claiming unified and complete group laws.

Most of them are, but only modulo the ideal generated by the curve equation.

All three types of Edwards have a simple neutral element and a symmetric group law; no need to reduce modulo an ideal.

$$\mathbf{H}_{c,d} : X^3 + Y^3 + cZ^3 = dXYZ$$

Suppose we let  $P = (X_1 : Y_1 : Z_1)$  and  $Q = (X_2 : Y_2 : Z_2)$

$P + Q = (X_3 : Y_3 : Z_3)$ , where

$$X_3 = cY_2Z_1^2Z_2 - X_1X_2^2Y_1$$

$$Y_3 = X_2Y_1^2Y_2 - cX_1Z_1Z_2^2$$

$$Z_3 = X_1^2X_2Z_2 - Y_1Y_2^2Z_1$$

$P + Q = (X_3 : Y_3 : Z_3)$ , where

$$X_3 = cY_2Z_1^2Z_2 - X_1X_2^2Y_1$$

$$Y_3 = X_2Y_1^2Y_2 - cX_1Z_1Z_2^2$$

$$Z_3 = X_1^2X_2Z_2 - Y_1Y_2^2Z_1$$

but  $Q + P = (X_4 : Y_4 : Z_4)$ , such that

$$X_4 = cY_1Z_1Z_2^2 - X_1^2X_2Y_2$$

$$Y_4 = X_1Y_1Y_2^2 - cX_2Z_1^2Z_2$$

$$Z_4 = X_1X_2^2Z_1 - Y_1^2Y_2Z_2$$

$P + Q = (X_3 : Y_3 : Z_3)$ , where

$$X_3 = cY_2Z_1^2Z_2 - X_1X_2^2Y_1$$

$$Y_3 = X_2Y_1^2Y_2 - cX_1Z_1Z_2^2$$

$$Z_3 = X_1^2X_2Z_2 - Y_1Y_2^2Z_1$$

but  $Q + P = (X_4 : Y_4 : Z_4)$ , such that

$$X_4 = cY_1Z_1Z_2^2 - X_1^2X_2Y_2$$

$$Y_4 = X_1Y_1Y_2^2 - cX_2Z_1^2Z_2$$

$$Z_4 = X_1X_2^2Z_1 - Y_1^2Y_2Z_2$$

Asymmetry of group law  $\implies$  need to reduce modulo the equation for  $\mathbf{H}_{c,d}$

Introduction

Elliptic Curves  
and  
CryptographyBinary  
Edwards  
CurvesPractical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

$$\widetilde{M}_d : X^2Y + XY^2 + dXYZ + Z^3 = 0$$

Arithmetic is quite flawed...

$$X^2Y + XY^2 + tXYZ + XZ^2 + YZ^2 = 0$$

Neutral element:  $\mathcal{O} = (1 : 1 : 0)$

$$X^2Y + XY^2 + tXYZ + XZ^2 + YZ^2 = 0$$

Neutral element:  $\mathcal{O} = (1 : 1 : 0)$

Unusual choice of neutral element  $\implies$  need to reduce modulo  
curve equation to see that  $P + \mathcal{O} = P$

# Pairings and Cryptography

Introduction

Elliptic Curves  
and  
CryptographyBinary  
Edwards  
CurvesPractical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

Pairings are bilinear forms over elliptic curves.

They've proven useful in cryptography, e.g. "MOV attack" and "Boneh-Franklin ID-based encryption."

Some work's been done on pairings for twisted Edwards curves, but not binary.

# Pairings and Cryptography

Pairings are bilinear forms over elliptic curves.

They've proven useful in cryptography, e.g. "MOV attack" and "Boneh-Franklin ID-based encryption."

Some work's been done on pairings for twisted Edwards curves, but not binary.

Their calculation hinges on finding a *Miller function*  $f$  with appropriate divisor  $\text{div}_P(f) = n(P) - n(\mathcal{O})$ .

# Directions for Future Work

Arène et.al. gave a new geometric interpretation of the twisted group law  $\implies$  calculation of pairings on  $E_{T,a,d}$  directly.

We'd like to do the same for  $E_{B,d_1,d_2}$ , but the geometry is different. . .

We give a theorem that's (hopefully) a step in the right direction.

## Following Arène et.al.

## Theorem

*Let  $P_1, P_2 \in E_{B,d_1,d_2}(K)$  be two affine, not necessarily distinct, points. Let  $C$  be the conic passing through  $\Omega_1, \Omega_2, \mathcal{O}', P_1$ , and  $P_2$  which must have the form*

$$c_{XY}(XY + Z^2) + c_{XZ}(XZ + Z^2) + c_{YZ}(YZ + Z^2)$$

*(If some of the above points are equal, we consider  $C$  and  $E_{B,d_1,d_2}$  to intersect with at least that multiplicity at the corresponding point.) Then the coefficients of the conic  $C$  are uniquely determined (up to scalars) as follows:*

$$\textcircled{1} P_1 \neq P_2, P_1 \neq \mathcal{O}', P_2 \neq \mathcal{O}' \implies$$

$$c_{XY} = Z_1 Z_2 [X_1(Y_2 + Z_2) + Y_1(X_2 + Z_2) + Z_1(X_2 + Y_2)]$$

$$c_{XZ} = Y_1 Z_2 (X_1 Y_2 + X_1 Z_2 + Z_1 Z_2) \\ + Y_2 Z_1 (Y_1 X_1 + Z_1 X_1 + Z_1 Z_2)$$

$$c_{YZ} = X_1 Z_2 (Y_1 X_2 + Y_1 Z_2 + Z_1 Z_1) \\ + X_2 Z_1 (X_1 Y_2 + Z_1 Y_2 + Z_1 Z_2)$$

$$\textcircled{2} P_1 \neq P_2 = \mathcal{O}' \implies c_{XY} = Z_1, c_{XZ} = Z_1, c_{YZ} = X_1$$

$$\textcircled{3} P_1 = P_2 \implies$$

$$c_{XY} = X_1^2 Y_1 + X_1 Y_1^2 + d_1 X_1 Z_1^2 + X_1^2 Z_1 + d_1 Y_1 Z_1^2 \\ + Y_1^2 Z_1 + X_1 Z_1^2 + Y_1 Z_1^2$$

$$c_{XZ} = X_1^2 Y_1 + d_1 Y_1^2 Z_1 + X_1 Y_1^2 + d_1 X_1 Z_1^2 + X_1^2 Z_1 \\ + d_1 Y_1 Z_1^2 + X_1 Y_1 Z_1 + d_1 Z_1^3 + Y_1 Z_1^2$$

$$c_{YZ} = d_1 X_1^2 Z_1 + d_2 X_1^2 Z_1 + d_2 Y_1^2 Z_1 + X_1^2 Z_1 + d_1 Z_1^3 + X_1 Z_1^2$$

Introduction

Elliptic Curves  
and  
CryptographyBinary  
Edwards  
CurvesPractical  
Considerations

Pairings

Applications

e2c2: a  
C++11 library

Conclusion

We offer two applications of binary Edwards curves:

- 1 ECOH's Echo, a PBKDF
- 2 A compartmented id-based secret sharing scheme with un/signcryption

This is a scalable PBKDF, for which we can increase computation time as computers get faster.

We modify ECOH, entrant to the SHA-3 competition.

Fixing its main issue, a second preimage attack, in turn leads to resistance to parallelization.

We build up  $Q$  from input, taking into account output of each previous step.

## ECOH's Echo, Finish

Finally,

$$X_1 \leftarrow \pi(Y_1)$$

$$X_2 \leftarrow \pi(Y_1 \oplus Y_2)$$

$$Q \leftarrow Q + X_1 + X_2$$

Return  $\varphi(Q)$

# Compartmented ID-Based Secret Sharing and Signcryption

My scheme extends a *secret sharing* (send a message to  $n$  entities in such a way that  $t$  of them must cooperate to put it back together) to a *compartmented scheme* (send a message to an organization broken into  $t$  compartments, one representative of each must cooperate).

# Compartmented ID-Based Secret Sharing and Signcryption

My scheme extends a *secret sharing* (send a message to  $n$  entities in such a way that  $t$  of them must cooperate to put it back together) to a *compartmented scheme* (send a message to an organization broken into  $t$  compartments, one representative of each must cooperate).

It involves *signcryption* so each compartment can verify the cooperation of the others and the signature of the original sender.

# Compartmented ID-Based Secret Sharing and Signcryption

My scheme extends a *secret sharing* (send a message to  $n$  entities in such a way that  $t$  of them must cooperate to put it back together) to a *compartmented scheme* (send a message to an organization broken into  $t$  compartments, one representative of each must cooperate).

It involves *signcryption* so each compartment can verify the cooperation of the others and the signature of the original sender.

Its cryptography is based on pairings.

In order to explore the theory and implementation of Edwards curves for elliptic curve cryptography, I've created a modern C++11 software library called e2c2.

It tries to bridge the gap between “proof-of-concept” and “production-ready.”

It's certainly not ready for cryptographic primetime, but it gets quite decent speed, even on my puny laptop, and the security afforded by the simplicity of implementing Edwards curves is very advantageous.

# Interlude

## e2c2 demonstration

# Contributions

To sum up, we saw

- ① that binary Edwards curves are safer than some other recently proposed normal forms
- ② how to calculate pairings on binary Edwards curves
- ③ (a glimpse of) two new cryptographic applications of binary Edwards curves
- ④ a demonstration of e2c2, a modern C++11 library for Edwards elliptic curve cryptography

Conclusion

I'm pursuing publication of some of this work

- ① Chapter 4 is online  
<http://eprint.iacr.org/2013/015>, and has been submitted to *IACR's CRYPTO2013* conference
- ② I'm in the process of revising a paper on the compartmented sharing scheme per reviewers' comments from the *Information Processing Letters*; see <http://eprint.iacr.org/2012/528> for a previous version
- ③ Recently a password hashing contest has been announced, see <https://password-hashing.net/>, and Dr. Zheng and I are hoping to submit ECOH's Echo

Many thanks to Dr. Zheng, Dr. Hetyei, rest of my defense committee, UNCC Math Department.
